

## Installing GoogleTest and GoogleMock on Linux (Ubuntu):

1. Download the source files from the GoogleTest github page <https://github.com/google/googletest> and unzip them.
2. Open a terminal and go to the googletest folder. Let's say it's ~/googletest-master
3. Install cmake, if you don't already have it installed:  
`sudo apt install cmake`
4. Build the project:  
`cmake CMakeLists.txt`  
`make`
5. Copy all the static libraries into /usr/lib:  
`cd lib`  
`sudo cp * /usr/lib`
6. Go to the *googlemock/include* subfolder and copy the entire *gmock* folder into /usr/local/include:  
`cd googlemock/include`  
`sudo cp -r gmock /usr/local/include`
7. Same way, from the project root folder (~/googletest-master) go to googletest/include and copy the entire *gtest* folder into /usr/local/include  
`cd googletest/include`  
`sudo cp -r gtest /usr/local/include`
